

# Understanding and Managing the Soils of Puna for Sustainable Food Production

Jonathan Deenik  
State Soil Fertility Specialist  
Department of Tropical Plant and Soil Sciences  
University of Hawaii

# Outline

- Soil Diversity
- Soils of Puna
- Soil Properties
- Soil Quality/Health
- Management Strategies for Healthy Productive Soils

# Soil Diversity

Hamakua: infertile ash soil

Kohala: fertile clay soils

Waimea: fertile, ash soils

Puna: a'a/pahoehoe soils

# Origin of Soil Diversity

## Factors

- Time
- Parent Material
- Climate
- Biota
- Topography

## Processes

- Physical weathering
- Chemical weathering

Time

Parent Material

Climate

Volcanic Ash

Andisols

Basalt

Histosols

CTAHR

# Origin of Soil Diversity

Climate - Precipitation

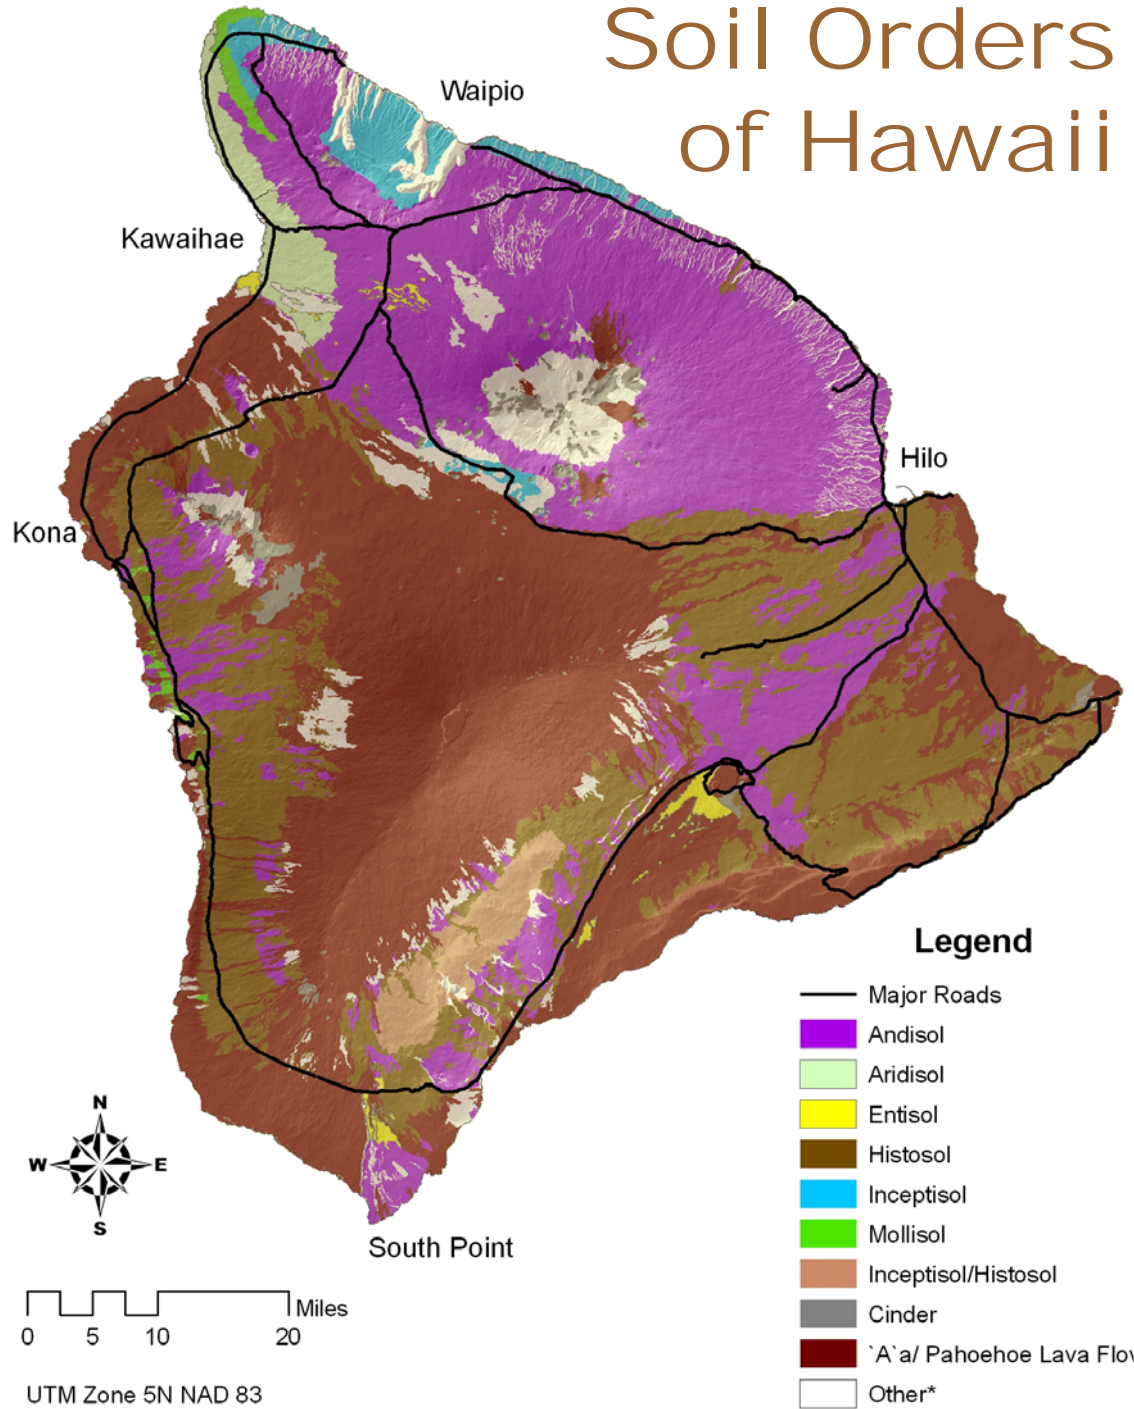

Wet = high weathering, acid & infertile  
*Akaka* series

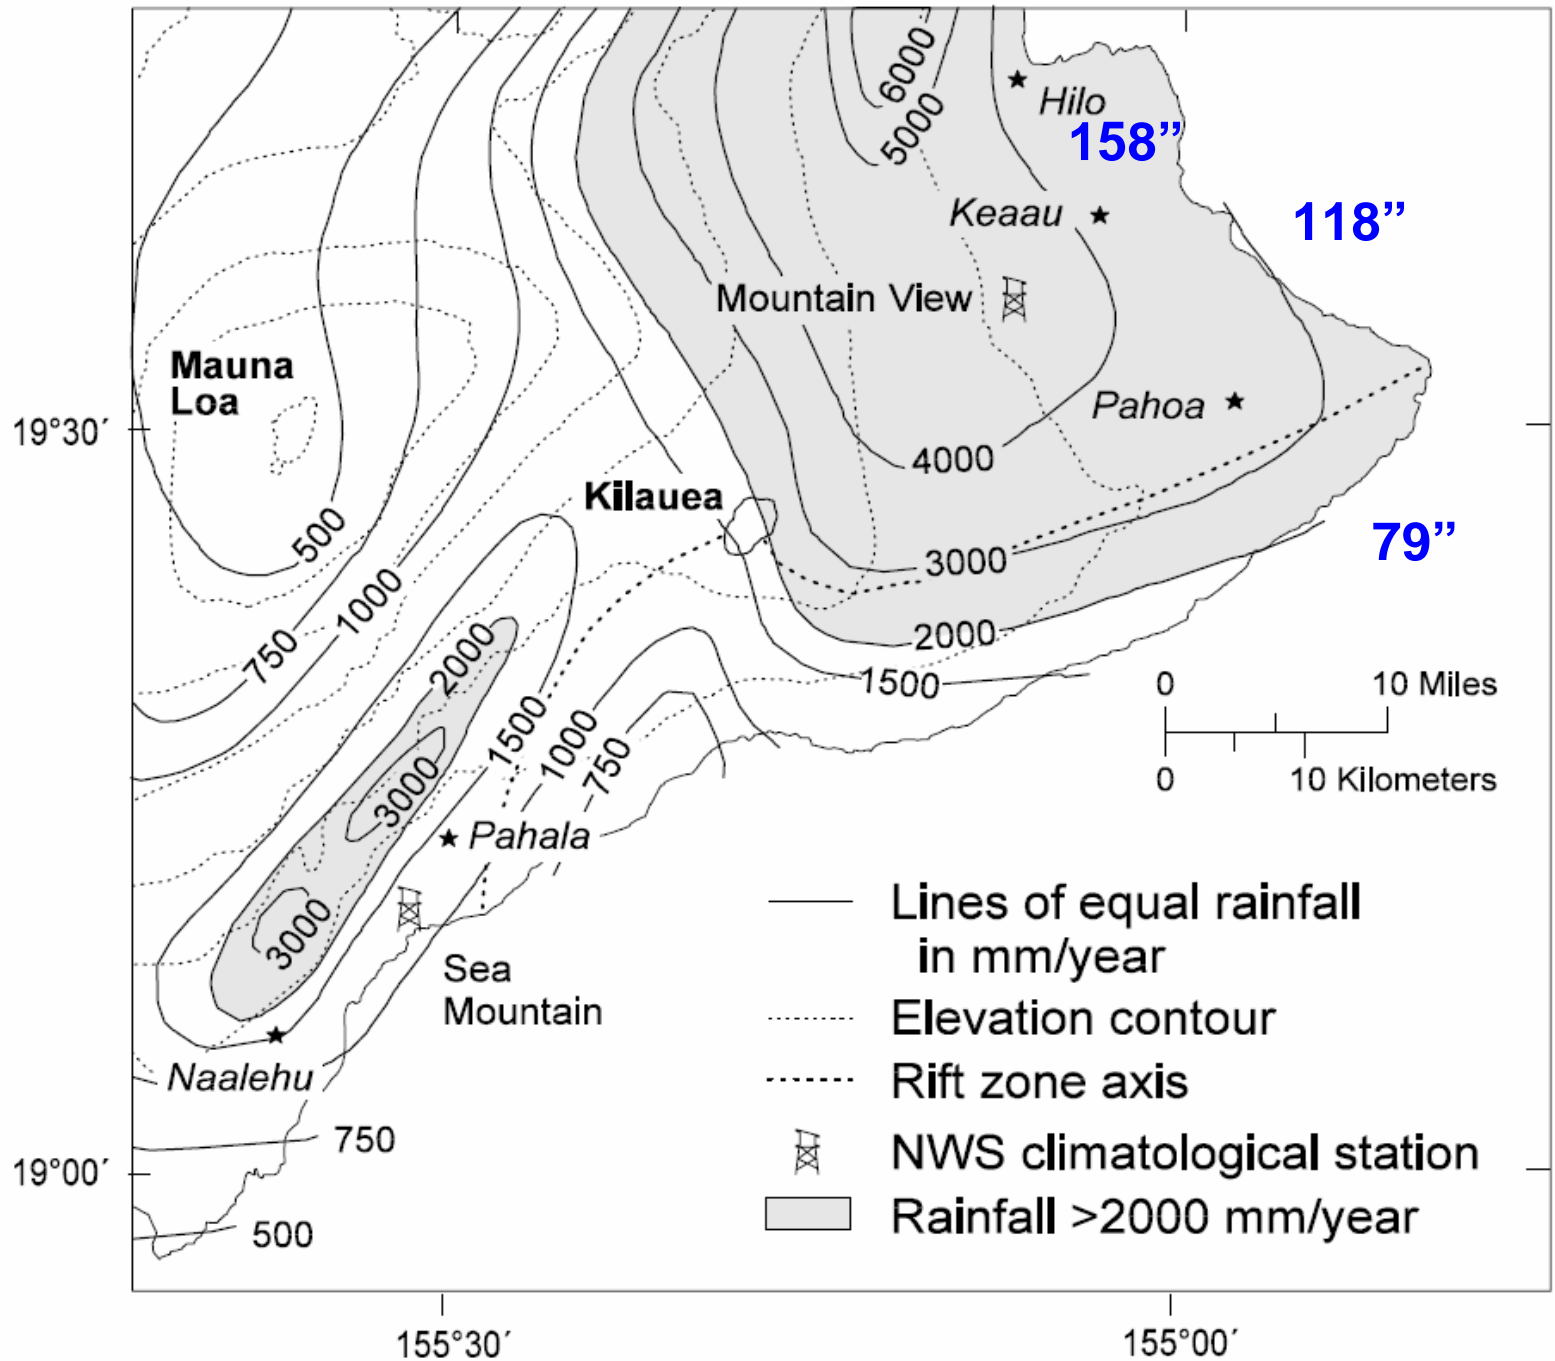

Dry = less weathering, fertile  
*Waimea* series

# Soil Orders of Hawaii

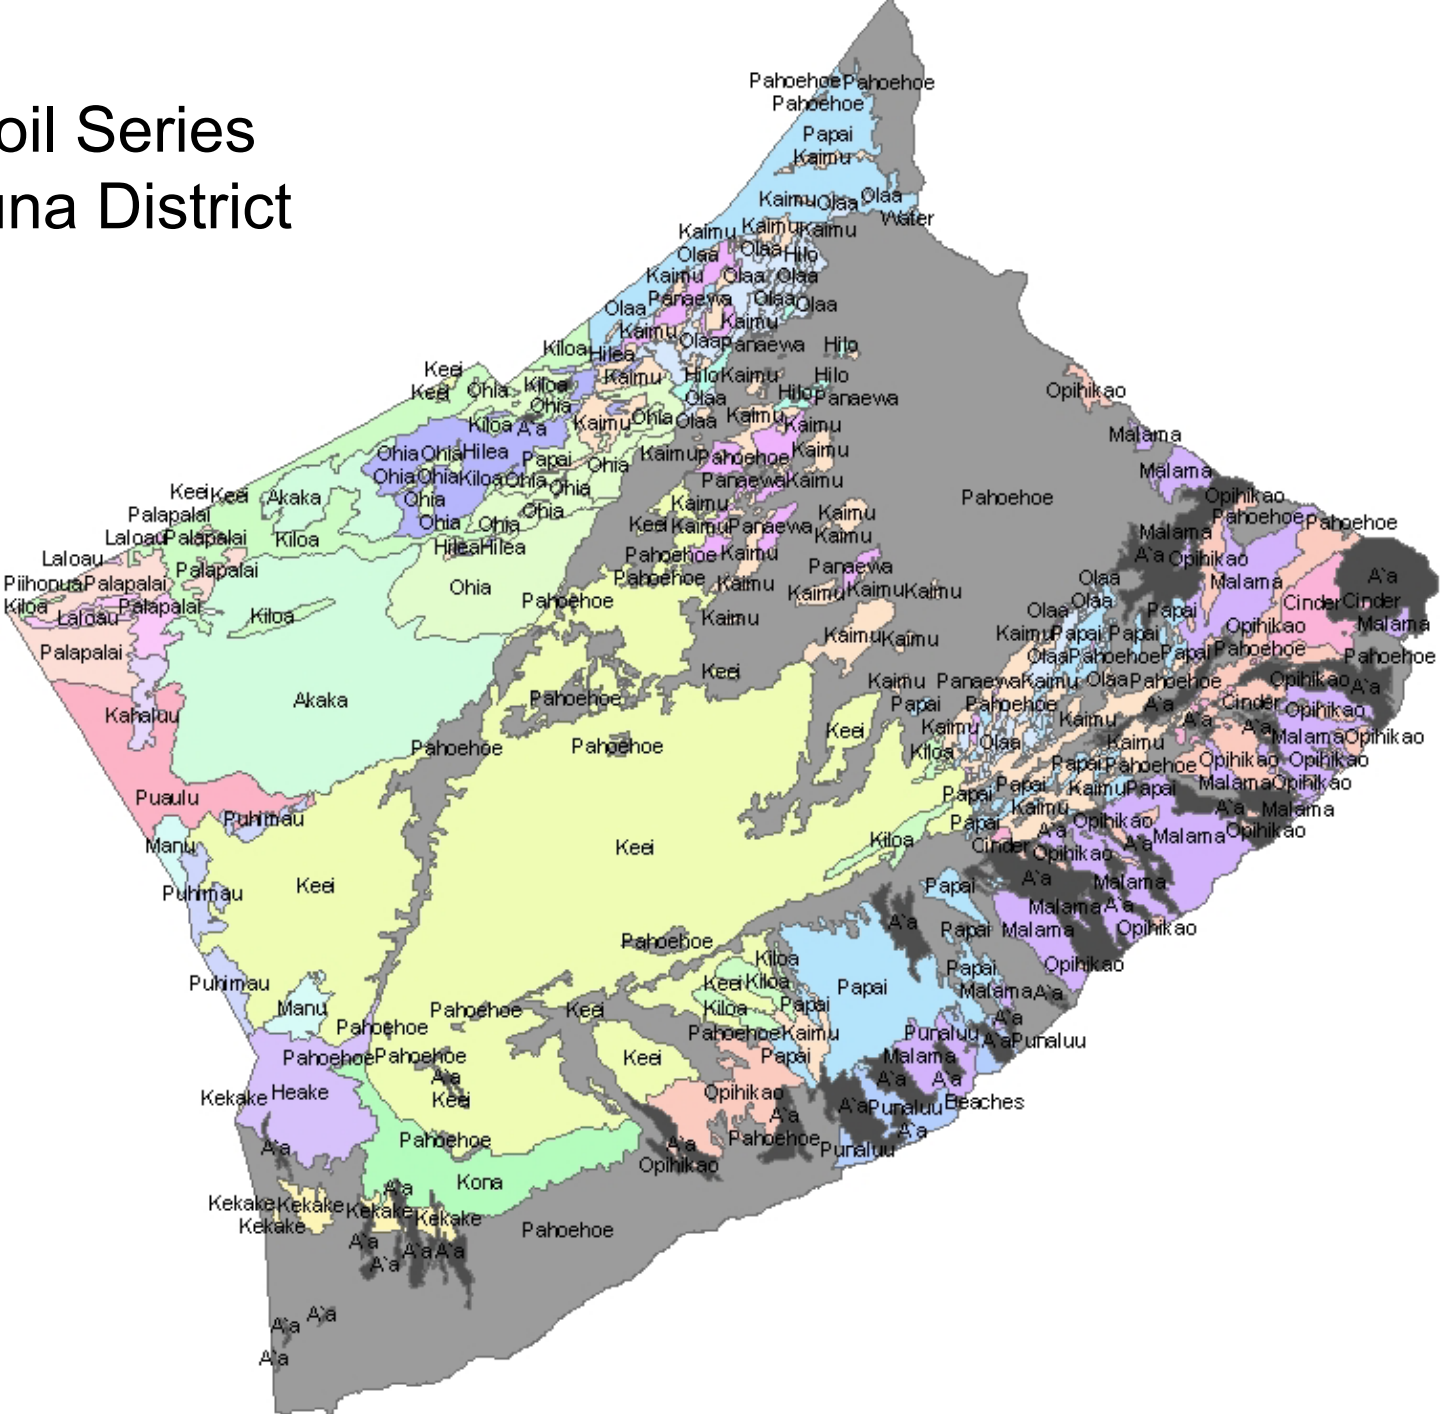

Source: USGS, Water-Resources Investigations Report, 1995

# 23 Soil Series in Puna District

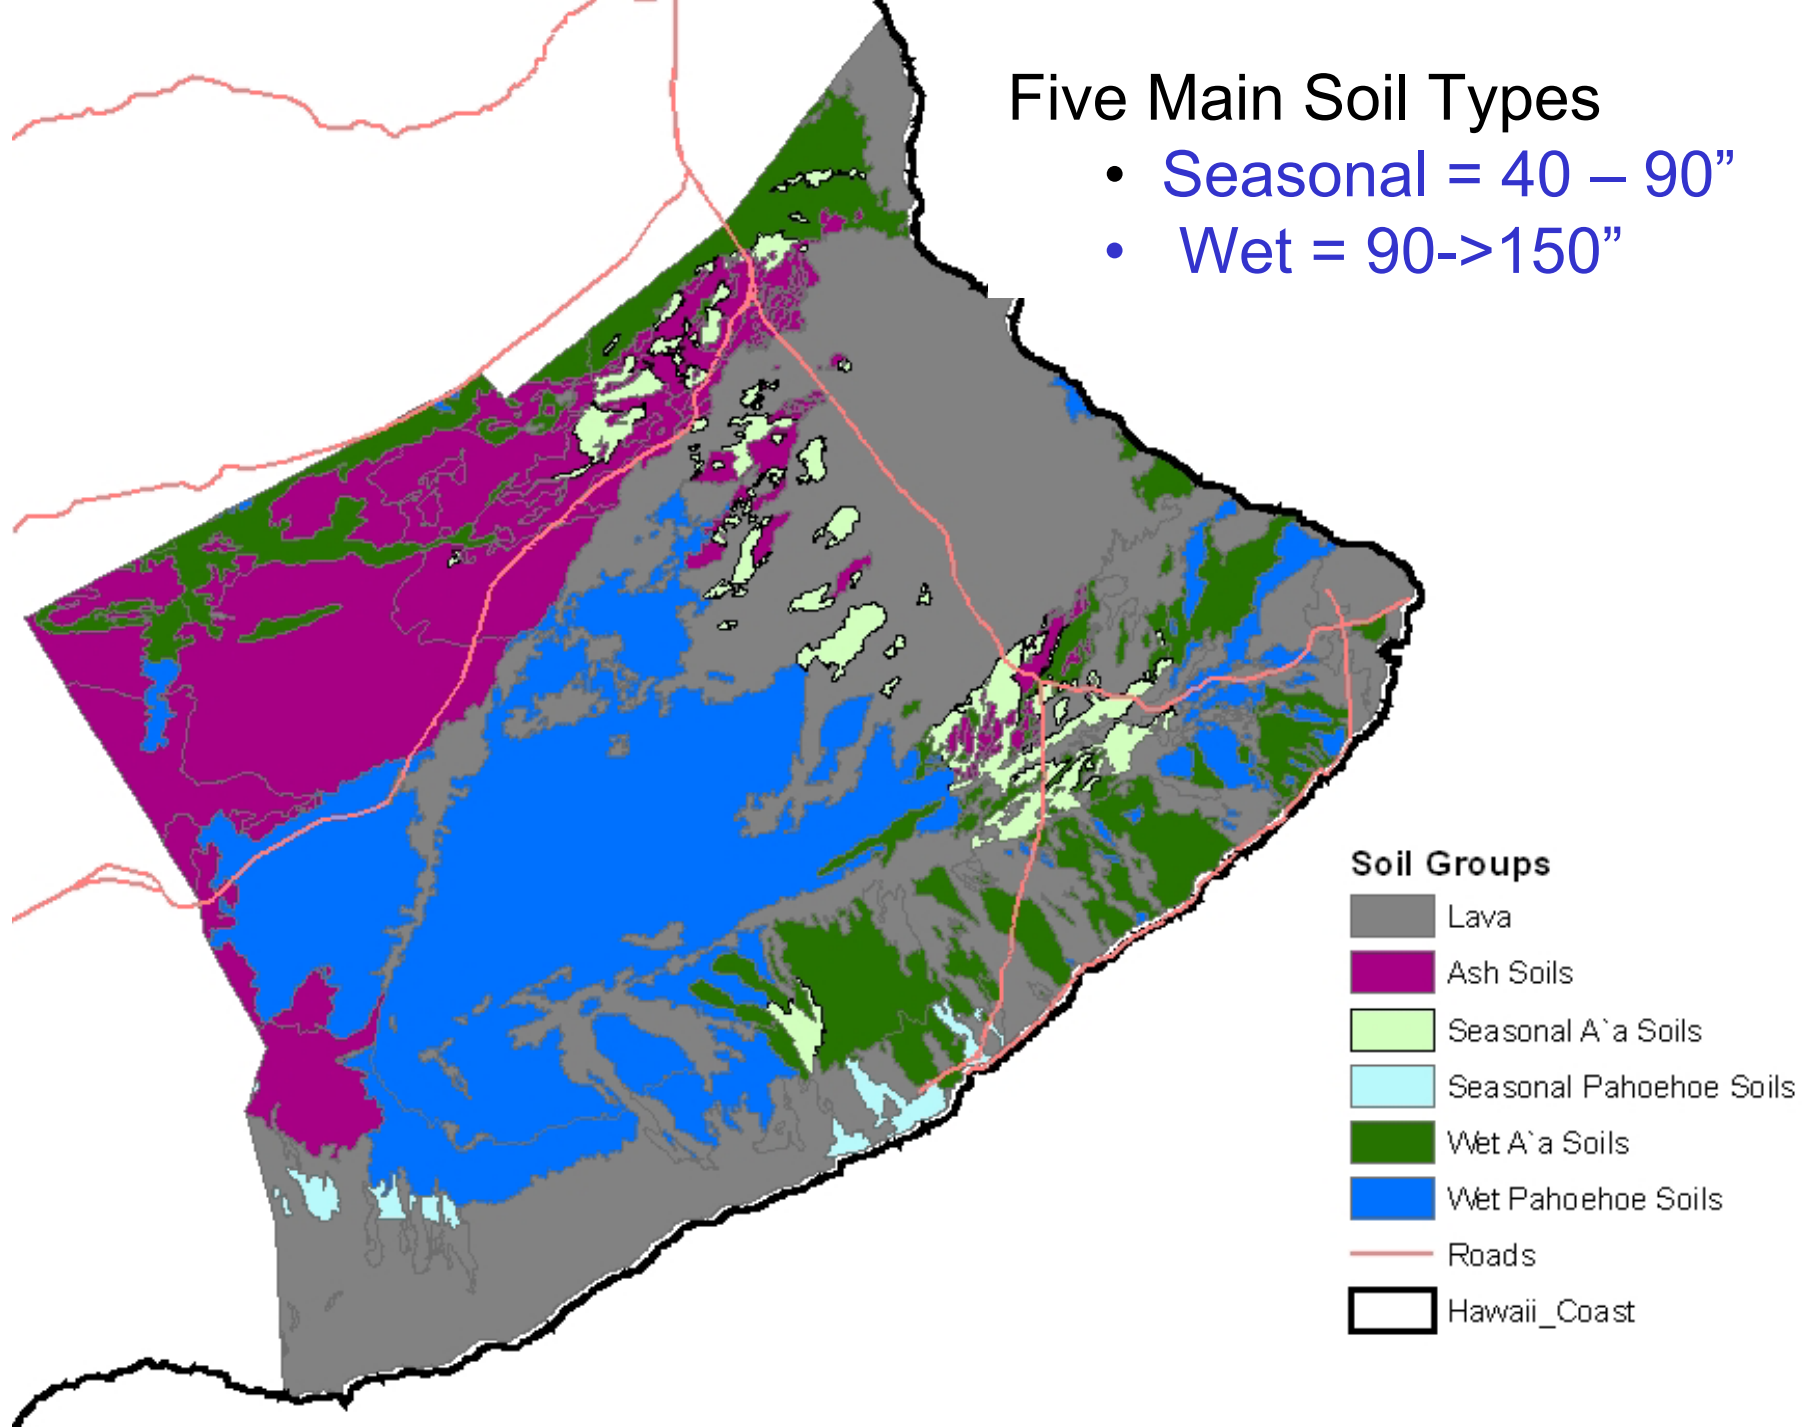

**Soil Series**

	A'a
	Akaka
	Beaches
	Cinder
	Heake
	Hilea
	Hilo
	Kahaluu
	Kaimu
	Keei
	Kekake
	Kiloa
	Kona
	Laloau
	Malama
	Manu
	Ohia
	Olaa
	Opihikao
	Pahoehoe
	Palapalai
	Panaewa
	Papai
	Piihonua
	Puauulu
	Puhimau
	Punaluu

## Five Main Soil Types

- Seasonal = 40 – 90”
- Wet = 90->150”

# A`a Soils

- Roads
- Soil Series**
-  Kaimu
-  Kiloa
-  Laloau
-  Malama
-  Papai

# Physical Properties of A`a Soils

- Dominated by coarse materials (80%)
- Minimal clay content
- Very low water retention capacity (droughty)
- Excessively well-drained
- Extremely difficult to cultivate

# Chemical Properties of A`a Soils

Management	OC	TN	pH	Ca	Mg	K	Na	CEC
	%					cmol <sub>c</sub> kg <sup>-1</sup>		
Forest	24.0	1.48	6.9	46.4	3.62	0.42	2.08	80.3
Cultivated	22.8	1.41	6.9	48.7	7.10	1.29	3.83	69.5

Source: Periswamy, 1973

- Organic matter is the primary source of nutrient supply and retention
- pH is relatively high due to high Ca
- K tends to be low under natural conditions

# Physical Properties of Pahoehoe Soils

- Even coarser than A`a soils
- Organic matter accumulation above solid pahoehoe lava

# Chemical Properties of Pahoehoe Soils

Management	OC	TN	pH	Ca	Mg	K	Na	CEC
	%							
						cmol <sub>c</sub> kg <sup>-1</sup>		
A`a	24.0	1.48	6.9	46.4	3.62	0.42	2.08	80.3
Pahoehoe	55.3	1.99	4.6	57.1	10.0	1.6	1.50	152

Source: Periswamy, 1973

- Organic matter accumulates to high levels in shallow organic layer above pahoehoe bedrock
- pH is typically very acid due to organic matter and no mixing with fine inorganic minerals

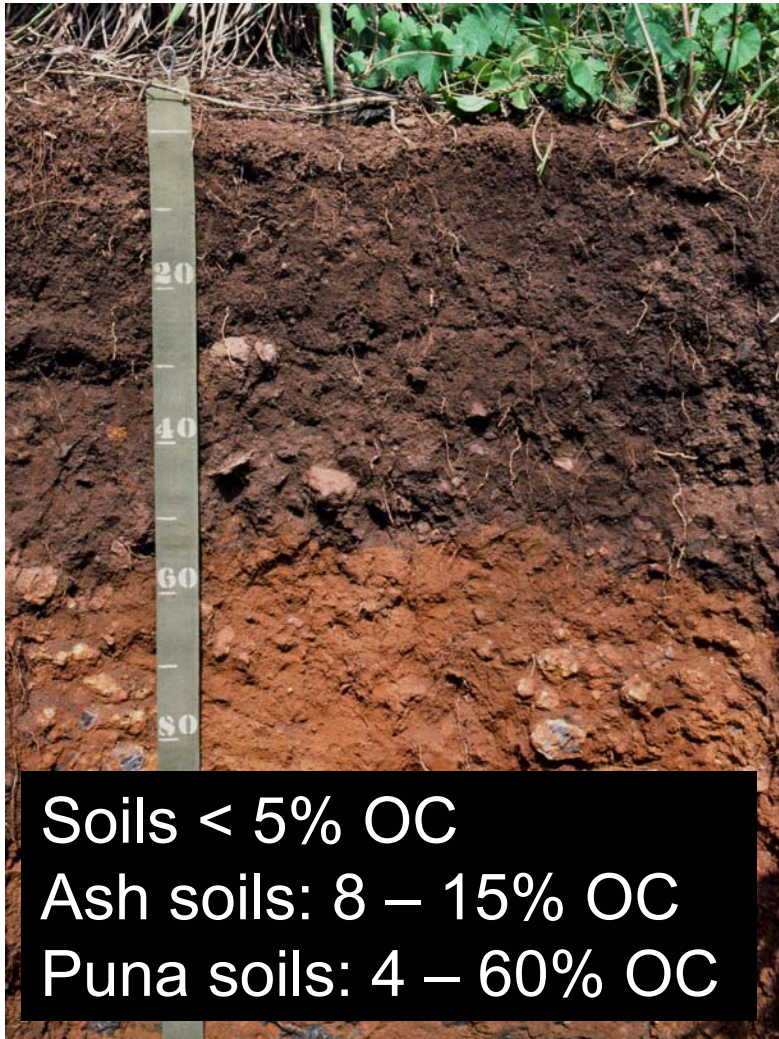

# Soil Properties

Conventional rules  
of soil science not  
always applicable  
to Puna soils

# Soil Organic Matter is Queen

# Humus

[www.californiagreensolutions.com](http://www.californiagreensolutions.com)

1. End product of decomposition
2. Relatively stable
  - half-life: decades to centuries
  - Humic substances (stable)
  - Non-humic substances (<stable)
3. Properties of Humic substances
  - high surface area
  - high charge density
4. Role
  - Increase water retention
  - Increase CEC

# Soil Water

Saturation

Field capacity

Wilting point

Source: Brady & Weil, 2004

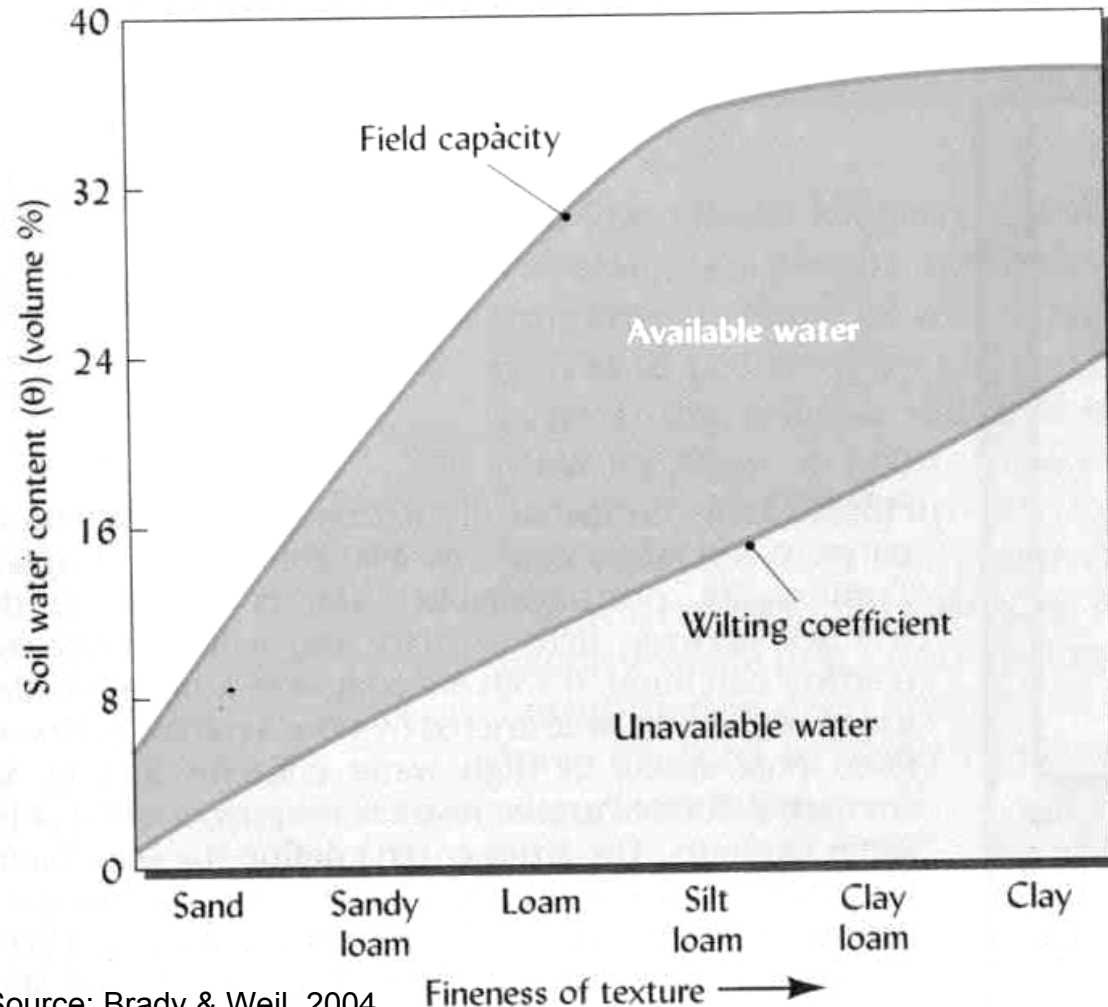

# Water Retention

Soil water holding capacity depends on texture

clay = high

sand = low

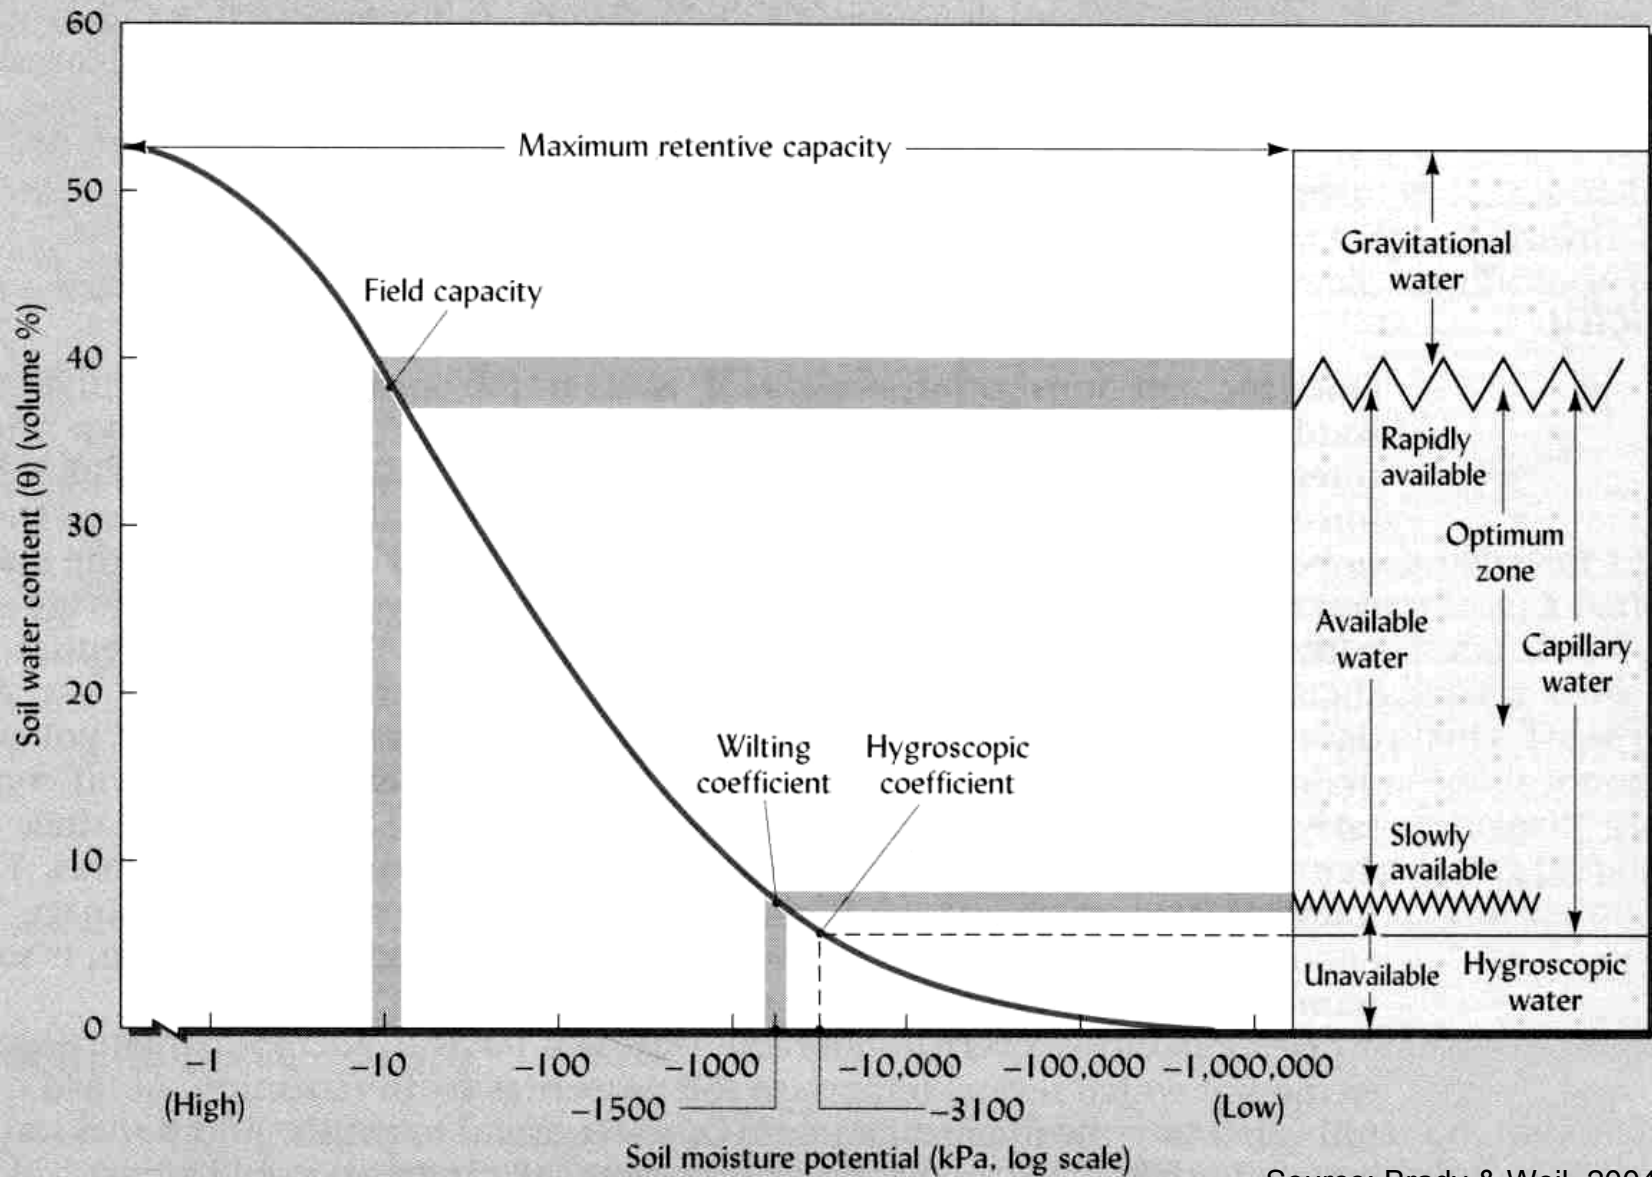

OM = high

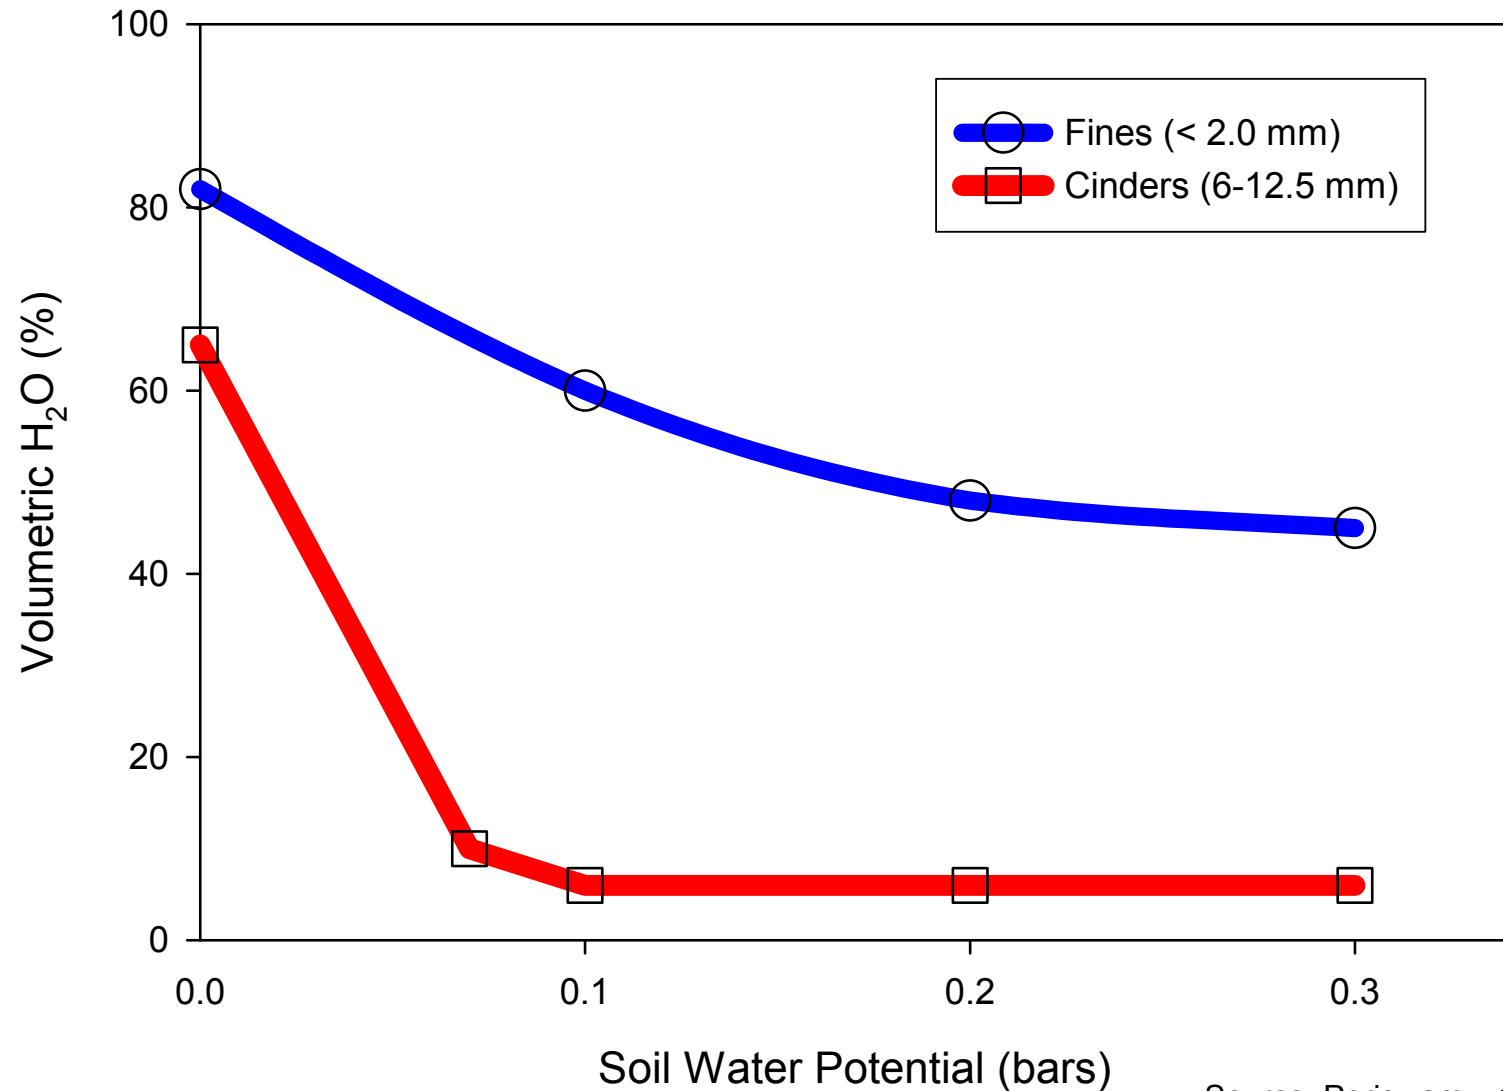

Source: Brady & Weil, 2004

Fineness of texture →

# Soil Water

# Water Release Curve

Source: Periswamy, 1973

# Water Storage

- 1.5 cm available water in 15 cm of soil
- Evapotranspiration = 0.39 cm/day
- $1.5/0.39 =$  almost 4 days before water consumed
- If roots could access 1 m of soil, then there would be 26 days of available water.
- **So, regular rainfall is necessary for good plant growth!**

# Cation Exchange Capacity

CEC is defined as the degree to which a soil can adsorb and exchange cations

( $\text{NH}_4^+$ ,  $\text{K}^+$ ,  $\text{Ca}^{++}$ ,  $\text{Mg}^{++}$ ,  $\text{Fe}^{++}$ .... )

CEC of humus =  $200 \text{ cmol}_c \text{ kg}^{-1}$

CEC of clays =  $10 - 80 \text{ cmol}_c \text{ kg}^{-1}$

# Cation Exchange Capacity

CEC of a surface soil =  $80.3 \text{ cmol}_c \text{ kg}^{-1}$ ,  
but this is for  $< 2 \text{ mm}$  Fraction,  
which makes up only 9.8% of the soil volume.

Converted to a volume,  
CEC =  $7.9 \text{ cmol}_c \text{ L}^{-1}$ , which is considered low.

A Waimea soil will have a CEC of around  
 $25 \text{ cmol}_c \text{ L}^{-1}$  in top 15 cm.

# Soil Acidity

# Effects of Soil Acidity

## Typical Acid Soils

- Al toxicity
- Mn toxicity
- Low base saturation
- P deficiency

## A`a/Pahoehoe Soils

- Can be very acid
- No Al toxicity because OM forms complexes w/ Al
- High base saturation because primary minerals release bases
- Low P fixation capacity

# Soil Organic Matter

- Physical

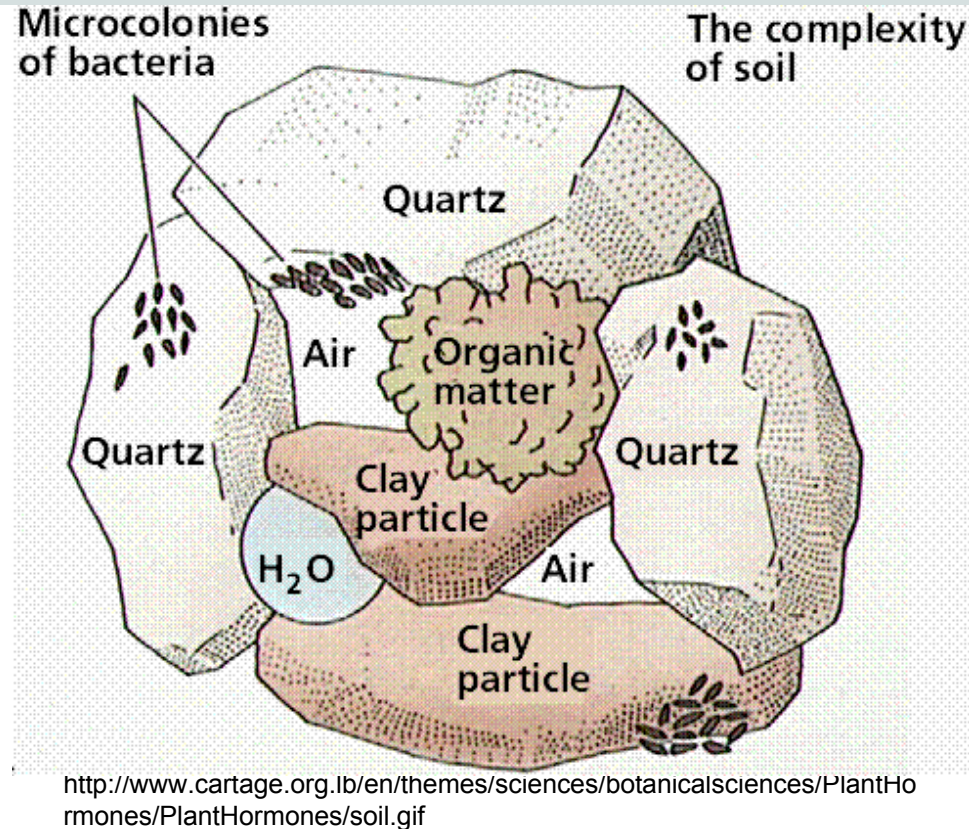

- Improves aggregation
- Improves water holding capacity (surface area)

- Chemical

- Increases nutrient availability (N & P cycling, solubility)
- Increases CEC
- Buffers against pH changes

- Biological

- Increases microbial diversity
- N fixation (rhizobia), P availability (mycorrhiza)
- Increases pathogen suppression

# Soil Organisms

## The Soil Food Web

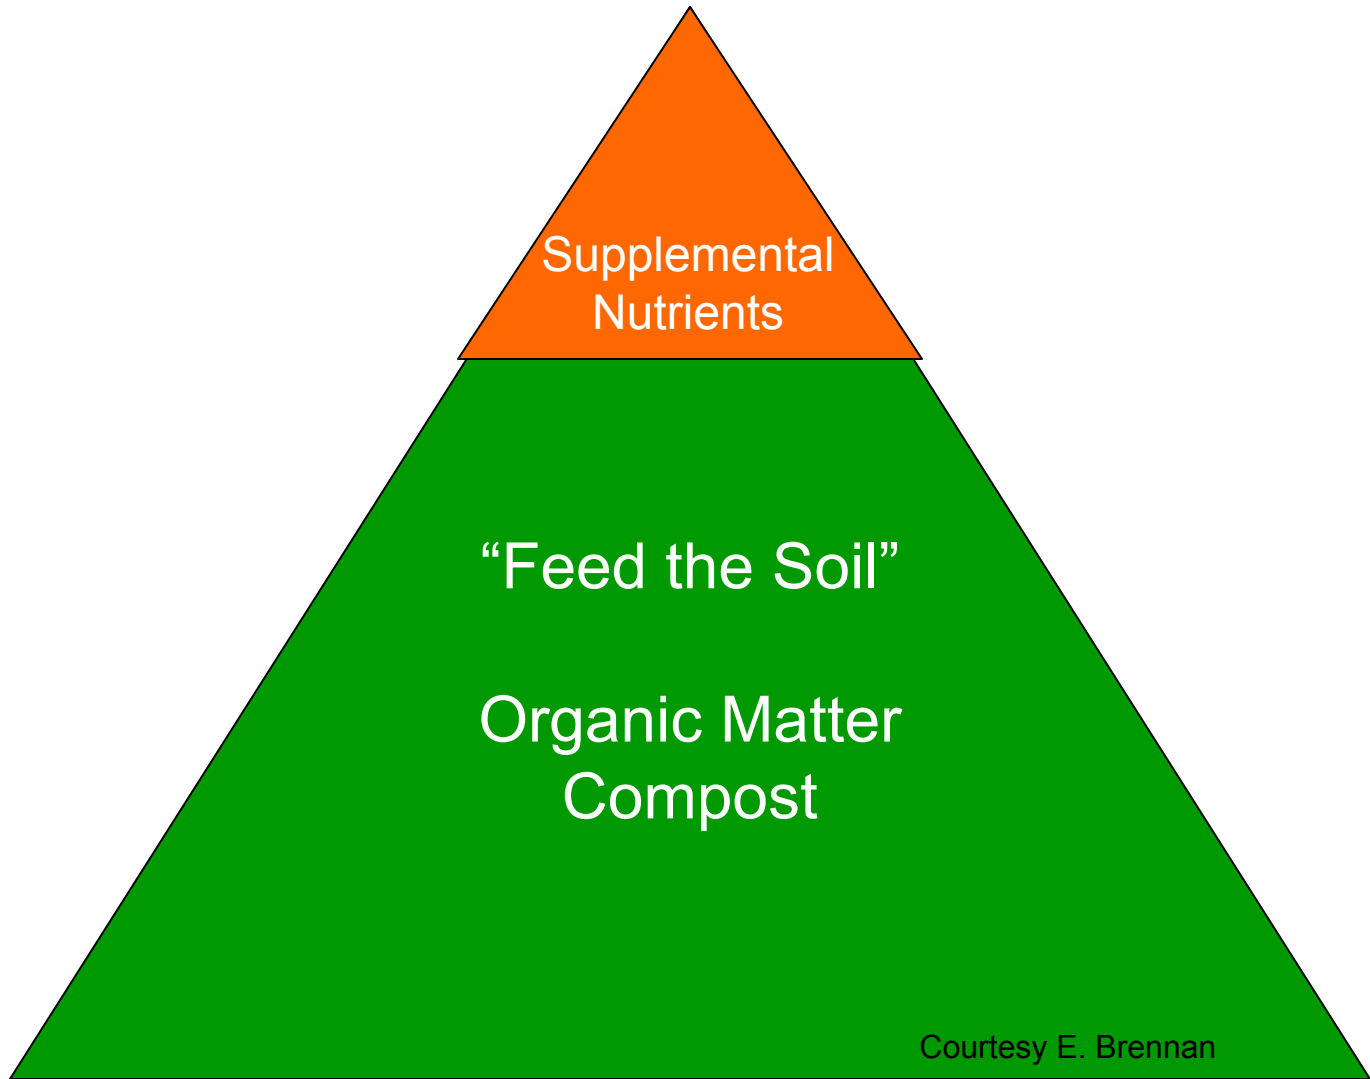

R.A. Norton

# Agricultural Potential of Puna Soils

- A`a soils better suited than Pahoehoe
- Rainfall should exceed 90"/yr
- Pahoehoe soils require higher rainfall to maintain good crop growth than a`a soils.
- Nutrient and water retention is low for these soils
  - low CEC leads to rapid leaching losses
  - high proportion of coarse fragments leads to low surface area and low water retention.

# Management for Soil Health and Food Security

# Compost

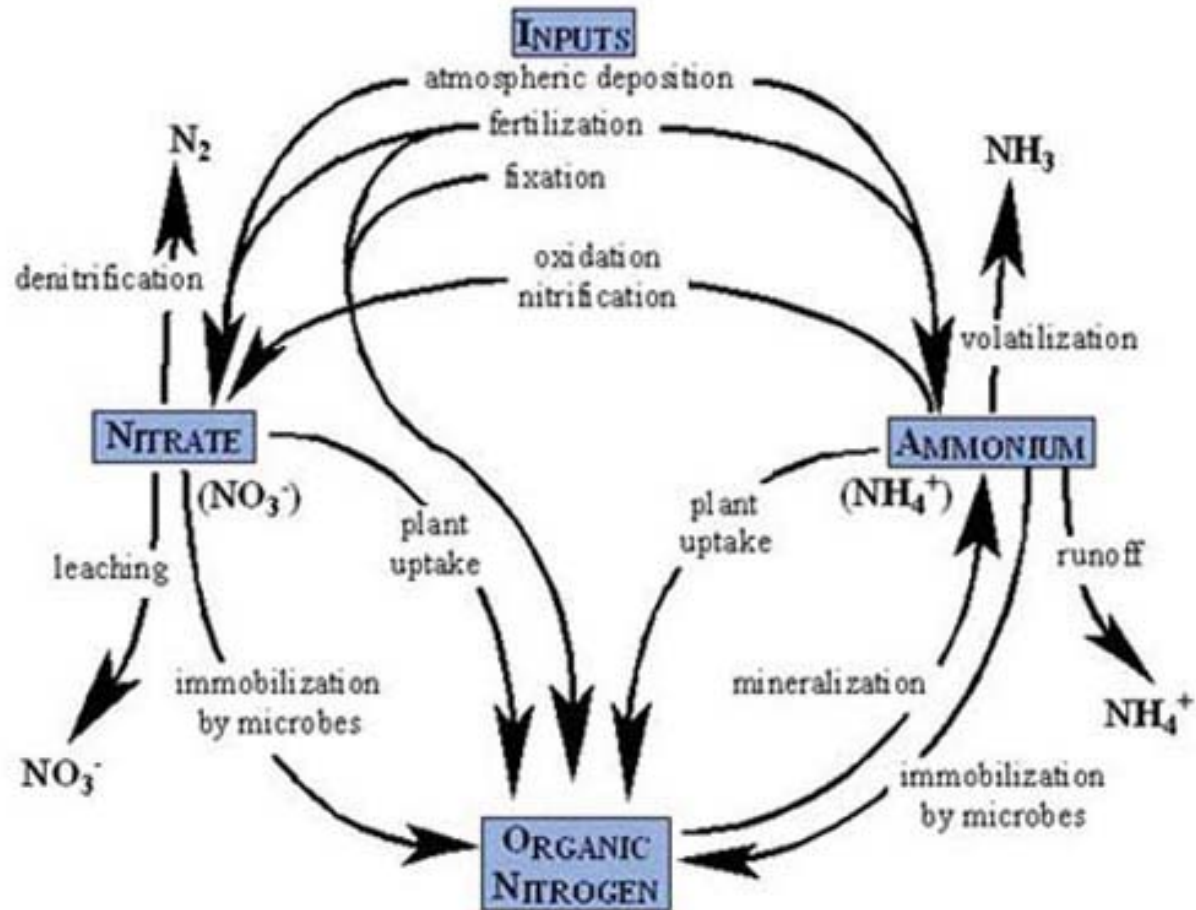

- Improves physical, chemical, and biological properties
- Need to add in large quantities ( $> 20$  T/acre)
- Relatively low N content ( $< 2.0\%$ )
- Slow-release nutrients

# N Management

## Losses

- Immobilization
- Leaching ( $\text{NO}_3^-$ )

Source: © U.S. Department of the Interior, National Park Service.

# N Management

## N Deficiency

- Yellowing of older leaves

# N Amendments

## Amendments

- Fish meal ( $\approx 10\%$  N)
- Feather meal (12 - 13% N)
- Chicken manure ( $\approx 3\%$  N)

## Cover Crops

- Sunn hemp
- Perennial peanut
- legumes

# P Amendments

## Organic

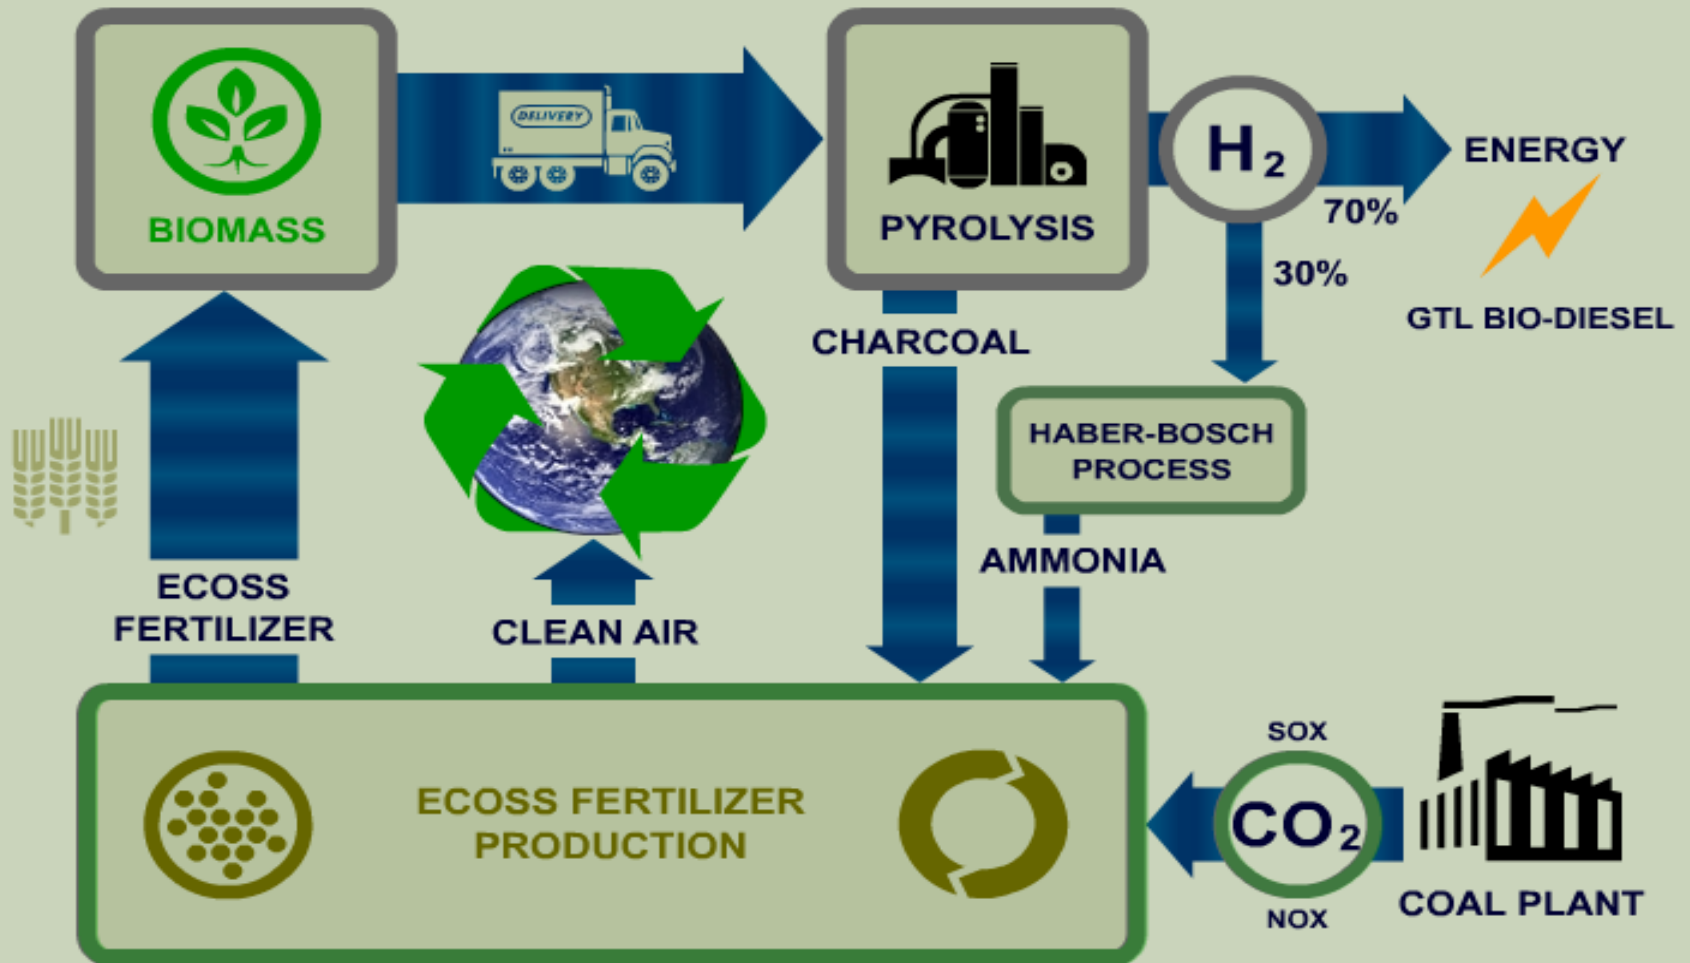

- Bone meal ( $\approx 12-15\%$  P)
- Rock phosphate (2-5% P)
- Chicken manure (2-3% P)

## Cover Crops

- Sunn hemp
- Sudex
- Oats

# Typical Upland Amazonian Soil

# Effect of Charcoal on Plant Growth

Photo source: <http://tinselwing.wordpress.com/tag/terra-preta/>

Charcoal Additions

No Charcoal Additions

# Charcoal as a Soil Amendment

## Potential Advantages

- Stable organic matter
- Good way to recycle invasive species/waste
- Increases water retention and CEC
- Promotes microbial diversity

Source: Cornell University

# Charcoal as a Soil Amendment

## Potential Disadvantages

- Some charcoals have negative effect on plant growth
- Some charcoal inhibits plant N uptake

# Summary

## Management Strategies

- Maximize organic matter inputs
  - compost
  - green manures
- Keep soil covered
  - cover crops
  - mulches
- Maximize biodiversity
  - multi-story planting

Mahalo!
