1. Cut pipe on the outside.

2. Pull intake pipes out of water and connect hose.

3. Attach the floating intake hose to the pipe. (There are various ways to do this)

4. Re-attach the pipe again using a union or coupler.

5. Other suggestions

   * Tether the intake to the opposite side of the tank to keep it from hugging the sides.
   * Put a plastic brace on the end near the screen to keep it from lying on the bottom of the tank when the tank is almost empty. You could use the bottom of a juice bottle or a plastic disk.
