Na‘u Pua o ka ‘Aina — It may surprise some to discover how much CTAHR’s programs reach out to Hawai‘i’s children and youth. These younger-than-college-age students benefit from the knowledge they gain and the hands-on, practical experience that accompanies the scientific data. With electronic devices, virtual realities, and increasing urbanization isolating our keiki from the green and growing world, we can be a bastion of the real. We can show that there is a difference between breeding a plant or analyzing the soil and watching a cartoon flower unfold on a screen. It’s to the College’s benefit as well to help children understand the unique work we do, to inspire them to learn more about it and, hopefully, pursue it when they’re grown. CTAHR needs a continuing influx of students to fill the growing needs for researchers, technicians, inspectors, retailers, plant and animal producers, and others in the food and agriculture system at large.

The stories in this quarter’s Impact Report emphasize our College’s connection with children and youth. USDA Chief Scientist and Under Secretary Vilsack, on her recent visit to the Islands, was able to experience the vibrancy and breadth of our youth outreach, first listening to Rachel Novotny’s presentation on CHL’s grant to help solve obesity in Pacific Island children and then in her interactions with CTAHR’s 4-H military program. The student group SOFT not only can teach their elders some things about green action; they’re also helping to inspire the next generation of growers. Educate to Eradicate goes into the classroom to teach elementary, intermediate, and high school students scientific information; just as importantly, it offers the children themselves the chance to reach out to and teach their communities and families. Because ultimately, the benefits of our unique partnership extend not just to the children and the College but to Hawai‘i as a whole. The state needs a wide range of trained personnel to support a growing population in ways that sustain our environment, keep people healthy through good nutrition, and build strong, resilient families.

Aloha,

Sylvia Yuen
Interim Dean and Director of CTAHR

Seekers of grants and CTAHR’s researchers are familiar with the National Institute for Food and Agriculture (NIFA), one of the four agencies comprising the USDA Department of Research, Education, and Economics (REE). The College was recently honored by a visit from what may have been the highest-level USDA official ever to grace our halls: Dr. Catherine Worshini, Chief Scientist and Under Secretary for Research, Education, and Economics. In town to present at a food security and safety workshop organized by Dean Sylvia Venu and Russell Kohub, Director of the Hawaii Department of Agriculture, in conjunction with the APEC conference, Dr. Worshini arrived a day to view and learn what the College is doing.

After giving a well-attended presentation to CTAHR faculty, staff, and students, Dr. Worshini facilitated a roundtable discussion on Science, Technology, Engineering, and Mathematics (STEM) education and workforce development. Then came a presentation by Rachel Novotny on the Children’s Healthy Living (CHL) Program, recently awarded $25 million to research obesity issues among Pacific Island children. Dr. Worshini then toured Pearl City’s Urban Garden in the company of Masters Gardener coordinator Jayme Grezbek and the associate deans, and experienced what a great resource this oasis is for the community. She also met with faculty and community clientle and visited the Sumida watercress farm to learn more about the College’s research and extension initiatives. Afterwards Dr. Worshini visited the Fort Shafter Youth Center, where children and youth in health, cooking, and Cloverhood 4-H military clubs showed off health and safety skills they’re learning. At each stop, with each presentation, CTAHR members and community partners were able to demonstrate how important, varied, and necessary the College’s programs are to our stakeholders. Because it’s all about impact. We can be proud that our programs encouraged a high-ranking and busy official to dedicate time away from the largest international summit ever held in Hawaii to see what CTAHR has to offer—since making an impact on USDA can enable us to make an even greater impact on our community.

A green wave of edible landscaping is sweeping gently over the campus, leaving in its wake a grove of banana plants here, a terraced rockery stocked with sweet potatoes and oregano there. Getting a class is becoming a mouthwatering experience. “Establishing on-campus plots can help promote our work by acting as living billboards” for the group, explains Gabe Sander-Smith, a core member. Eager tasters can head over to SOFT’s farm stand, held Mondays from 12 to 2 outside of St. John Laboratory. For nominal sums they’ll receive ripe ‘ulu, eggplants, chili peppers, and other fresh and local—very local—products, and they’ll also have the satisfaction of supporting the group’s future efforts.

Because SOFT is all about the future—they have big plans, both for the campus and for ways to involve students and other local schools, it’s an exciting time to be involved in CTAHR’s partnership with Noelani elementary school, in which student volunteers, led by Nate Ortiz, help Noelani first-grade classes to prepare the soil, plant the seeds and starts, and harvest the bounty in their own plots at the nearby CTAHR Maunakea Experiment Station. But also offers broader scientific and academic skills, from objective observation to creating and testing a hypothesis. Kindergarteners listen to the story of Tammy the Termite’s life, as told by a puppet, while older students learn about chemical signaling and symbiosis and practice dissection. Several classroom teachers have received awards for their successful implementation of the curriculum, including Tanya Ashimine of Kaiser High School, who was recently awarded the national President’s Prize for Outstanding Achievement by the Entomological Society of America.

The education doesn’t just take place in the classroom. The project uses the fact that kids love to teach their elders in order to disseminate important termite eradication and prevention information throughout the community. For instance, a group of schoolchildren in Palama settlement went door to door through their neighborhood, offering kupuna fliers they’d created with basic prevention tips.

This leads to the program’s second benefit: It’s helping to eradicate this serious threat, putting an appreciable dent in the damage done by termites. With a short-term goal of increasing community awareness and implementation of termite prevention measures and a long-term goal of increasing termite awareness and scientific literacy in the homeowners and homeowners of tomorrow, Educate to Eradicate has lofty goals... and, unlike some termite-riddled houses, a solid foundation.

The two-fold benefits are laid out in the name. Focusing on a single organism not only educates children about termites but also offers broader scientific and academic skills, from objective observation to creating and testing a hypothesis. Kindergarteners listen to the story of Tammy the Termite’s life, as told by a puppet, while older students learn about chemical signaling and symbiosis and practice dissection. Several classroom teachers have received awards for their successful implementation of the curriculum, including Tanya Ashimine of Kaiser High School, who was recently awarded the national President’s Prize for Outstanding Achievement by the Entomological Society of America.

D.C. Comes to CTAHR

Seekers of grants and CTAHR’s researchers are familiar with the National Institute for Food and Agriculture (NIFA), one of the four agencies comprising the USDA Department of Research, Education, and Economics (REE). The College was recently honored by a visit from what may have been the highest-level USDA official ever to grace our halls: Dr. Katherine Woteki, Chief Scientist and Under Secretary for Research, Education, and Economics. In town to present at a food security and safety workshop organized by Dean Sylvia Ijjo and Russell Kohuk, Director of the Hawaii Department of Agriculture, in conjunction with the APEC conference, Dr. Woteki arranged a day to visit and learn what the College is doing.

After giving a well-attended presentation at CTAHR faculty, staff, and students, Dr. Woteki facilitated a roundtable discussion on Science, Technology, Engineering and Mathematics (STEM) education and workforce development. Then came a presentation by Rachel Novotny on the Children’s Healthy Living (CHL) Program, recently awarded $25 million to research obesity issues among Pacific Island children. Dr. Woteki then toured Pearl City’s Urban Garden in the company of Master Gardener coordinator Jayme Grebike and the associate deans, and experienced what a great resource this oasis is for the community. She also met with faculty and community clientelle and visited the Sumida watercress farm to learn more about the College’s research and extension initiatives. Afterwards Dr. Woteki visited the Fort Shafter Youth Center, where children and youth in health, cooking, and Cleverbud military clubs showed off health and safety skills they’d learned. At each stop, with each presentation, CTAHR members and community partners were able to demonstrate how important, varied, and necessary the College’s programs are to our stakeholders.

Because it’s all about impact. We can be proud that our programs encouraged a high-ranking and busy official to dedicate time away from the largest international summit ever held in Hawaii! to see what CTAHR has to offer—since making an impact on USDA can enable us to make an even greater impact on our community.

No Chewing Allowed

It’s always the pint-sized chewers, and that controlling them requires constant vigilance and occasional clouds of irish chinch, crinch...pitter, patter.... What’s that? It just might be the sound of your house being eaten by termites. You probably know that Hawaii’s warm climate and predominance of wooden construction make it a tasty haven for these wood-chewers, and that controlling them requires constant vigilance and occasional clouds of striped tenting. You might even know the name of the most common and formidable of these cellulose snackers: Formosan subterranean termite, or FSTT. For more detailed information, though, you might try asking your kids.

Kenneth Grace’s and Julian Yates’ (FEPS) innovative program Educate to Eradicate aims to provide curriculum, materials, and support to classroom teachers to teach children, from kindergarten through 12th grade, about termites. The 10-year-old program, funded largely by USDA-ARS, has taught more than 10,000 students in 371 classrooms and has also directly reached over 2,000 adults in an annual educational seminar series.

The two-fold benefits are laid out in the name: Focusing on a single organism not only educates children about termites but also offers broader scientific and academic skills, from objective observation to creating and testing a hypothesis. Kindergarteners listen to the story of Tammy the Termites’ life, as told by a puppet, while older students learn about chemical signaling and symbiosis and practice dissection. Several classroom teachers have received awards for their successful implementation of the curriculum, including Tanya Ashumine of Kaiser High School, who was recently awarded the national President’s Prize for Outstanding Achievement by the Entomological Society of America.

The education doesn’t just take place in the classroom. The project uses the fact that kids love to teach their elders in order to disseminate important termite eradication and prevention information throughout the community. For instance, a group of schoolchildren in Palama Settlement went door to door through their neighborhood, offering kupuna fliers they’d created with basic prevention tips.

This leads to the program’s second benefit: It’s helping to eradicate this serious threat, putting an appreciable dent in the damage done by termites. With a short-term goal of increasing community awareness and implementation of termite-prevention measures and a long-term goal of increasing termite awareness and scientific literacy in the homeowners and homebuilders of tomorrow, Educate to Eradicate has lofty goals... and, unlike some termite-riddled houses, a solid foundation.

Greening Schools

When Douglas Vincent, the chair of the Human Nutrition, Food and Animal Sciences department, first lobbied in 2007 for funds for a student group that wanted to dig up UH-Manoa’s carefully landscaped grounds and plant beans, people might have thought he’d gone soft. But really, he’d just gone SOFT. That’s the Student Organic Farm Training group, advised by Ted Bedovich and other CTAHR faculty, and it’s on a mission to promote sustainable agriculture and ecological awareness—one campus plot at a time.

A green wave of edible landscaping is sweeping gently over the campus, leaving in its wake a grove of banana plants here, a terraced rockery stocked with sweet potatoes and oregano there. Getting it all on campus is class is becoming a mouthwatering experience. “Establishing on-campus plots can help promote our work by acting as living billboards,” the group’s umbrella explains Gabe Saechman-Smith, a core member.

Tage tasters can head over to SOFT’s farm stand, held Mondays from 12 to 2 outside of St. John Laboratory. For nominal sums they’ll receive ripe ‘ulu, eggplants, chili peppers, and other fresh and local—very local—products, and they’ll also have the satisfaction of supporting the group’s future efforts.

Because SOFT is all about the future—they have big plans, both for the campus and for ways its ready-to-eat plantings can inspire others. They’re also involved in CTAHR’s partnership with Noelani elementary school, in which student volunteers, led by Nate Ortiz, help Noelani first-grade classes to prepare the soil, plant the seeds and starts, and for ways its ready-to-eat plantings can inspire others. They’re also involved in CTAHR’s partnership with Noelani elementary school, in which student volunteers, led by Nate Ortiz, help Noelani first-grade classes to prepare the soil, plant the seeds and starts, and harvest the bounty in their own plots at the nearby CTAHR Ma˜noa Magoon Research and Instruction Facilities. Children of all ages love to get their hands dirty, but more important are the program’s academic benefits: It’s teaching the kids about counting and measuring, scientific investigation, nutrition, and ecology. This successful partnership is in its second year now, growing as vigorously as a well-tended stalk of corn.

The education doesn’t just take place in the classroom. The project uses the fact that kids love to teach their elders in order to disseminate important termite eradication and prevention information throughout the community. For instance, a group of schoolchildren in Palama Settlement went door to door through their neighborhood, offering kupuna fliers they’d created with basic prevention tips.

This leads to the program’s second benefit: It’s helping to eradicate this serious threat, putting an appreciable dent in the damage done by termites. With a short-term goal of increasing community awareness and implementation of termite-prevention measures and a long-term goal of increasing termite awareness and scientific literacy in the homeowners and homebuilders of tomorrow, Educate to Eradicate has lofty goals... and, unlike some termite-riddled houses, a solid foundation.

D.C. Comes to CTAHR

Seekers of grants and CTAHR's researchers are familiar with the National Institute for Food and Agriculture (NIFA), one of the four agencies comprising the USDA Department of Research, Education, and Economics (REE). The College was recently honored by a visit from what may have been the highest-level USDA official ever to grace our halls: Dr. Catherine Woteki, Chief Scientist and Under Secretary for Research, Education, and Economics. In town to present at a food security and safety workshop organized by Dean Sylvia Yuen and Russell Kokubun, Director of the Hawaii Department of Agriculture, in conjunction with the APEC conference, Dr. Woteki arranged a day to visit and learn what the College is doing.

After giving a well-attended presentation to CTAHR faculty, staff, and students, Dr. Woteki facilitated a roundtable discussion on Science, Technology, Engineering and Mathematics (STEM) education and workforce development. Then came a presentation by Rachel Novotny on the Children's Healthy Living (CHL) Program, recently awarded $25 million to research obesity issues among Pacific Island children. Dr. Woteki then toured Pearl City’s Urban Garden in the company of Master Gardener coordinator Jayme Grzebik and the associate dean, and experienced what a great resource this oasis of green is for its community. She also met with faculty and community clientele and visited the Sumida watercress farm to learn more about the College's research and extension initiatives. Afterwards Dr. Woteki visited the Fort Shafter Youth Center, where children and youth in health, cooking, and Cleverbord 4-H military clubs showed off health and safety skills they’d learned. At each stop, with each presentation, CTAHR members and community partners were able to demonstrate how important, varied, and necessary the College’s programs are to our stakeholders.

Because it’s all about impact. We can be proud that our programs encouraged a high-ranking and busy official to dedicate time away from the largest international summit ever held in Hawaii to see what CTAHR has to offer—since making an impact on USDA can enable us to make an even greater impact on our community.

No Chewing Allowed

Rinch, crinch...pitter, patter... What’s that? It just might be the sound of your house being eaten by termites. You probably know that Hawaii’s warm climate and predominance of wooden construction make it a tasty haven for these woodchewers, and that controlling them requires constant vigilance and occasional clouds of striped tenting. You might even know the name of the most common and formidable of these cellulose snackers: Formosan subterranean, or ground, termites. For more detailed information, though, you might try asking your keiki.

Kenneth Grace and Julian Yates’ (PEPS) innovative program Educate to Eradicate aims to provide curriculum, materials, and support to classroom teachers to teach children, from kindergarten through 12th grade, about termites. The 10-year-old program, funded largely by USDA-ARS, has taught more than 10,000 students in 371 classrooms and has also directly reached over 2,000 adults in an annual education seminar series.

The two-fold benefits are laid out in the name. Focusing on a single organism not only educates children about termites but also offers broader scientific and academic skills, from objective observation to creating and testing a hypothesis. Kindergarteners listen to the story of Tammy the Termite’s life, as told by a puppet, while older students learn about chemical signaling and symbiosis and practice dissection. Several classroom teachers have received awards for their successful implementation of the curriculum, including Tamya Ashmine of Kaiser High School, who was recently awarded the national President’s Prize for Outstanding Achievement by the Entomological Society of America.

The education doesn’t just take place in the classroom. The project uses the fact that kids love to teach their elders in order to disseminate important termite eradication and prevention information throughout the community. For instance, a group of schoolchildren in Palama Settlement went door to door through their neighborhood, offering kupuna fliers they’d created with basic prevention tips.

This leads to the program's second benefit: It’s helping to eradicate this serious threat, putting an appreciable dent in the damage done by termites. With a short-term goal of increasing community awareness and implementation of termite-prevention measures and a long-term goal of increasing termite awareness and scientific literacy in the homeowners and homeowners of tomorrow, Educate to Eradicate has lofty goals... and, unlike some termite-riddled houses, a solid foundation.

Greening Schools

When Douglas Vincent, the chair of the Human Nutrition, Food and Animal Sciences department, first lobbyist in 2007 for funds for a student group that wanted to dig up UH-Manoa’s carefully landscaped grounds and plant beans, people might have thought he’d gone soft. But really, he’d just gone SOFT. That’s the Student Organic Farm Training group, advised by Ted Radovich and other CTAHR faculty, and it’s on a mission to promote sustainable agriculture and ecological awareness—one campus plot at a time.

A green wave of edible landscaping is sweeping gently over the campus, leaving in its wake a grove of banana plants here, a terraced rockery stocked with sweet potatoes and oregano there. Getting a class is becoming a mouthwatering experience. “Establishing on-campus plots can help promote our work by acting as living billboards for the group,” explains Gahe Sachtner-Smith, a core member. Eager tasters can head over to SOFT’s farm stand, held Mondays from 12 to 2 outside of St. John Laboratory. For nominal sums they’ll receive ripe ‘ulu, eggplants, chili peppers, and other fresh and local—very local—products, and they’ll also have the satisfaction of supporting the group’s future efforts.

Because SOFT is all about the future—they have big plans, both for the campus and for ways its ready-to-eat plantings can inspire others. They’re also involved in CTAHR’s Partnership with Noelani elementary school, in which student volunteers, led by Nate Ortiz, help Noelani first-grade classes to prepare the soil, plant the seeds and starts, and tend the garden.

The Educate to Eradicate program aims to teach children about termites while offering scientific and other academic skills.

The One-Acre Garden’s instructor, Kenneth Grace, has also directly reached over 2,000 adults in an annual education seminar series.
It may surprise some to discover how much CTAHR’s programs reach out to Hawai‘i’s children and youth. These younger-than-college-age students benefit from the knowledge they gain and the hands-on, practical experience that accompanies the scientific data. With electronic devices, virtual realities, and increasing urbanization isolating our keiki from the green and growing world, we can be a bastion of the real. We can show that there is a difference between breeding a plant or analyzing the soil and watching a cartoon flower unfold on a screen.

It’s to the College’s benefit as well to help children understand the unique work we do, to inspire them to learn more about it, and, hopefully, pursue it when they’re grown. CTAHR needs a continuing influx of students to fill the growing needs for researchers, technicians, inspectors, retailers, plant and animal producers, and others in the food and agriculture system at large.

The stories in this quarter’s Impact Report emphasize our College’s connection with children and youth. USDA Chief Scientist and Under Secretary Wortki, on her recent visit to the Islands, was able to experience the vibrancy and breadth of our youth outreach, first listening to Rachel Novotny’s presentation on CHL’s grant to help solve obesity in Pacific Island children and then in her interactions with CTAHR’s 4-H military program. The student group SOFT not only can teach their elders some things about green action; they’re also helping to inspire the next generation of growers. Educate to Eradicate goes into the classroom to teach elementary, intermediate, and high school students scientific information; just as importantly, it offers the children themselves the chance to reach out to and teach their communities and families.

Because ultimately, the benefits of our unique partnership extend not just to the children and the College but to Hawai‘i as a whole. The state needs a wide range of trained personnel to support a growing population in ways that sustain our environment, keep people healthy through good nutrition, and build strong, resilient families.

Aloha,

Sylvia Yuen
Interim Dean and Director of CTAHR
