COVER CROP
PLANT AVAILABLE NITROGEN (PAN) CALCULATOR

KOON-HUI WANG, ARCHANA PANT, THEODORE RADOVICH, JARI SUGANO, JENSEN UYEDA
Cover the soil at all times
Reduce soil disturbance
Synergize with diversity: Crop rotation
Grow a living root 24/7

2015 International Year of Soils

Unlock the Secrets in the Soil
BENEFITS OF COVER CROPPING

1. Reduce fertilizer costs
2. Add organic matter
3. Improve yields by enhancing soil health
4. Reduce the need for herbicides and other pesticides (nematicide)
5. Prevent soil erosion
6. Conserve soil moisture
7. Protect water quality
8. Help safeguard personal health
9. Some cover crops offer harvest possibilities as forage, grazing or seed in multiple crop enterprises.
SUMMER LEGUMES

- Leguminous cover crops can contribute significant amount of nitrogen to crop production. However, farmers need a better tool to accurately estimate the nitrogen contribution from legumes so as to precisely reduce fertilizer rates.

Sunn hemp  Cowpea  Lablab  Pigeon pea  Velvet bean
WINTER LEGUMES

- Woolypod vetch
- Hairy vetch
- Bell bean
- Austria winter pea
- White clover
NON-LEGUMES

Annual ryegrass

Oat ‘TAMU 406’

Sorghum sudangrass

Oil radish ‘SodBuster’
Cover Crop Chart for Hawaii

Grass

High Elevation

Broad Leaves

Low Elevation

Grass

Nematode Resistant

- Barley 70 lb/acre
- Cereal Rye 100 lb/acre
- Oat 90 lb/acre
- Winter Wheat 120 lb/acre
- Annual Ryegrass 100 lb/acre
- Rape Seed 15 lb/acre
- Red Clover 20 lb/acre
- Oil Radish 10 lb/acre

- Canola 15 lb/acre
- Yellow Sweet Clover 20 lb/acre
- White Clover 15 lb/acre
- Red Clover 20 lb/acre
- Oil Radish 10 lb/acre

- Wolly pod Vetch 75 lb/acre
- Jack bean 50-60 lb/acre
- Hairy vetch 40 lb/acre
- Bell Bean 200 lb/acre
- Austrian Winter Pea 20 lb/acre

- Buckwheat 90 lb/acre
- Mustard 15 lb/acre
- Mustard 15 lb/acre
- Soybean 50-75 lb/acre
- Austrian Winter Pea 20 lb/acre

- Sesame 4 lb/acre
- Pearl Millet 15 lb/acre
- Oat 90 lb/acre
- Black Oat 75 lb/acre
- Grain Sorghum 50-75 lb/acre

A = annual; B = Biennial; P = Perennial; SP = Short-term perennial.
R = resistant to root-knot but not reniform nematode; (note: only certain cultivars are resistant to root-knot nematodes for alfalfa and cowpea; cowpea is very susceptible to reniform nematode).
S = suppressive to plant-parasitic nematodes if soil incorporated.
S* = sunn hemp and velvetbean are resistant to root-knot and reniform nematodes; marigold, Tagetes patula is resistant to root-knot and reniform, T. erecta is only resistant to root-knot; sesame is resistant to southern and peanut root-knot nematode (Meloidogyne incognita and M. arenaria) but not Javanica root-knot (M. javanica).
PLANT AVAILABLE NITROGEN (PAN)

- Although cover crops can fix or accumulate nitrogen (N) in plant tissues, not all the N in the tissue will be released into a plant available form.

Plant Available Nitrogen (PAN %) = \[
\frac{[\text{Soil nitrate with cover crop (mg/kg)} - \text{soil nitrate without cover crop}]}{\text{Total N added by cover crop (mg/kg)}} \times 100
\]

% N in tissue \times \text{cover crop biomass} = \text{Total N}
FACTORS AFFECTING PAN% FROM COVER CROP

- climate conditions, season
- soil types
- cover crop species
- biomass, plant age, % N in tissue
- time after cover crop termination
- farming practices (till vs no-till)
- microbial activities in your soil
% Tissue N varied among cover crop species.

Total N from cover crop is based on biomass × % tissue N.

Some cover crop released PAN more efficient than others (70.5% vs 55.2%).

Actual PAN can be strongly influenced by cover crop biomass.
CONVENTIONAL TILL vs NO-TILL

</tbody>
</table>

- PAN released % was higher in summer than winter.
- Grassy cover crops had lower % N and slower PAN released % compared to legumes, but those in oil radish are equivalent or higher than legumes.
PAN released % could change from location to location.

Although N % in these cover crops were higher than the tropical legumes tested earlier, the actual PAN released were lower.

Farmers could calculate amount of N fertilizer needed to full-fill the crop requirement.

</table>
Although PAN release rate at 70 days after cover crop termination were similar among all legumes and oil radish tested, actual PAN released varied mainly due to the biomass generated. **Thus, it is a good practice for farmers to estimate the cover crop biomass.**

Graminaceous cover crops generally had lower PAN%, resulted in lower actual PAN regardless of the biomass generated. None-the-less, graminaceous cover crops are good nutrient scavenging crops, and soil C builders.

Majority of the PAN were released during the first 28 days after cover crop termination, thus **additional fertilizer should be added there after.**
